

A Versioned Object is like a git or other version control system repository, except that it has an extra layer of versioning called the Undo graph built in.

The purpose of the Undo graph is to undo bad changes to the underlying history graph, such as user mistakes when creating or deleting branches, undoing merges, etc.

Undo Node
(contents not shown)

As explained above, each Undo Node corresponds to the state of a normal version control system's repository.

Named Branch
(contents not shown)

Named Branch
Name: Trunk
History Node: ●

Named Branch
Name: Dev
History Node: ●
